Ananya Raghunathan

Platform Engineer

CONTACT

ananya.raghunathan@example.org
Pune, India

SKILLS

- Backstage
- Crossplane
- GKE
- Tekton
- Flux
- Helm
- Open Policy Agent
- TypeScript
- Go
- Cloud Build
- Pulumi
- Prometheus

LANGUAGES

- English (fluent)
- Marathi (native)
- Hindi (fluent)

CERTIFICATIONS

- Google Cloud Professional Cloud DevOps Engineer

EDUCATION

- B.E. Computer Engineering, Sahyadri College of Engineering (2014 – 2018)

SUMMARY

Platform engineer building internal developer tooling. I treat the platform as a product: user research, roadmaps and measured adoption. Technically I work with Crossplane, Backstage, GKE and Tekton, and I like pairing with application teams to remove friction. I write regularly on the engineering blog, give talks at the local platform meetup in Pune, and mentor two junior colleagues who are moving from application development into infrastructure.

EXPERIENCE

Platform Engineer, Orchid Mobility Technologies 2021 – Present

- Launched a Backstage-based developer portal with software templates; new services now reach production in two days instead of three weeks.
- Provide self-service databases and queues through Crossplane compositions on GCP.
- Operate GKE clusters managed with Flux, with admission policies written in Open Policy Agent.
- Run monthly developer surveys; satisfaction score rose from 6.1 to 8.4.
- Established a service catalogue with ownership metadata, which allowed incident responders to find the right team in seconds.
- Introduced golden-path templates for APIs, workers and scheduled jobs, with security scanning built in.
- Pair with application teams during their first deployments to understand where the platform confuses people, then fix the root cause.
- Publish a quarterly platform roadmap and changelog so teams can plan around deprecations and new capabilities.

Software Engineer, Tooling, Kaveri Cloud Systems 2018 – 2021

- Wrote command-line tools in Go for the internal support team.
- Maintained Tekton pipelines for twelve repositories.
- Documented onboarding steps and recorded short training videos.
- Added cost visibility in the portal so that teams can see monthly spend per service.
- Rolled out a deprecation process for old tooling with clear dates and migration guides.
- Ran internal workshops on declarative configuration and on reading cluster events when something goes wrong.
