SKILLS

- Windows Server 2019
- Active Directory
- VMware ESXi
- Veeam
- Linux
- Fortinet firewalls
- SCCM
- Zabbix
- SQL Server backups

LANGUAGES

- English (fluent)
- Tamil (native)

CERTIFICATIONS

- Microsoft Certified: Windows Server Hybrid Administrator

EDUCATION

- B.Sc. Computer Science, Madras Coastal College (2015 – 2018)

SUMMARY

Systems administrator with six years of experience handling servers, backups and user support in a manufacturing group. I like checklists, clear tickets and doing the dull things properly. I enjoy working directly with plant managers to understand which systems matter most to production and plan maintenance around shifts. I am studying for a cloud fundamentals certification in my evenings.

EXPERIENCE

Systems Administrator, Coromandel Auto Components — 2020 – Present

- Look after 45 servers across two plants; maintain 99% availability for production planning systems.
- Patch servers monthly using SCCM and a documented rollback plan.
- Support Active Directory, shared drives and printing for 600 users.
- Review backup reports daily and perform quarterly restore tests.
- Prepared and tested a disaster recovery plan for the production planning database, with recovery in under two hours.
- Replaced an ageing firewall pair with a managed high-availability setup, with a planned cutover at a weekend.
- Coordinate maintenance windows with production supervisors so that updates happen during planned stoppages.
- Monitor server health, disk growth and backup success using Zabbix dashboards and daily checks.
- Manage user accounts, mailbox quotas and permissions through documented request and approval steps.
- Prepare monthly availability and incident reports for the plant IT manager and track improvement actions to closure.

Support Engineer, Marina IT Services — 2018 – 2020

- Resolved desktop and server tickets for several clients.
- Installed and configured firewalls and switches during office moves.
- Learned scripting and wrote a few small PowerShell tools to report on stale accounts and disk usage.
- Documented network diagrams for both plants.
- Replaced faulty hardware, reinstalled operating systems and supported users by phone and remote tools.
- Kept a simple knowledge base of fixes that colleagues could follow.
